DO YOU ALSO GET TIRED STANDING IN LOG QUEUES IN YOUR COLLEGE CANTEEN'S ?

- Cannot Reach in Time For Lecture
- No Management of Food
- No Bills Sometimes
- Long Queues
- No Covid Precautions
- Mood gets down

ABSTRACT

As canteen in colleges get extremely crowded nowadays, so in this project, we concentrate on fast service of food to the users to reduce paper work and save the time of the student by avoiding long queue and to keep things organized. This will satisfy all the customers need and overall sale of the canteen will increase. This application program reduces the manual work for managing the Canteen. Students can place their order through the e-menu available on the mobile application which would be further transferred to the canteen. The student can therefore know their order details and the order progress through the mobile application. The canteen manages the students order and keeps updating the progress of the order through their web application. The admin manages the student and canteen through the web application.

INTRODUCTION

- Canteen in colleges get extremely crowded nowadays
- We concentrate on fast service of food to the users to reduce paper work and save the time of the student by avoiding long queue and to keep things organized.
- Reduces the manual work for managing the Canteen. Students can place their order through the e-menu available on the mobile application which would be further transferred to the canteen.
- Student can therefore know their order details and the order progress through the mobile application.
- The canteen manages the students order and keeps updating the progress of the order through their web application. The admin manages the student and canteen through the web application.

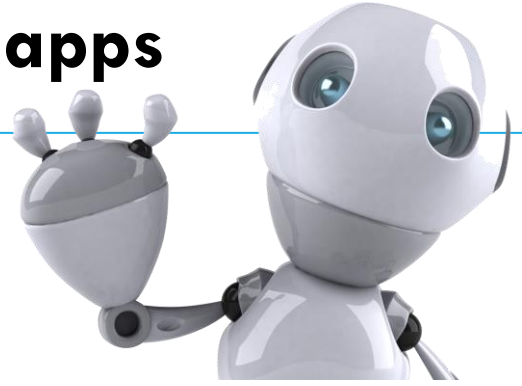
First Canteen App
Fayaz Karedia

Study of Different IEEE Papers

Use of old methods like maintaining registers.

Many Authors designed an old version of Canteen apps



LITERATURE SURVEY (Conti….)

FayazKaredia, Pranit Hule and Shariq Memon have developed an automation system using android in which the end user can access the app and place an order which is received by the canteen and further processing of the order is done. While the customer waits for their order, he/she may receive a complete track of the order being placed, prepared and ready. The canteen uses the web application login to access the orders placed by the student. All management is done by the admin through the web application.[1]

Lavina Mall and Nihal Shaikh have developed automation process by using Radio Frequency Identification (RFID) card, an RFID card reader, a tablet and hosting the application on cloud. This automation process when applied on an integral part of the working people i.e. “canteen” helps reduce the service time, eliminates queues, there is no burden to provide the exact change to the staff for the order; to name a few benefits on the canteen’s customer side and on the other hand it provides a reliable way of storing records and keeping the money safe as mostly the payments are made online via virtual money; benefits for the canteen owner.[2]

SCOPE

1. All the orders placed by the students will be in digital format hence no chance of human error and tedious work.

2. As it is online the customer doesn't have to wait for the waiter to take their order and doesn't has to wait for the food as well

3. Canteen workers will not have to remember each and every order placed and this will make their task easy.

4. Waiters don't have to manually calculate the amount of money to be paid by the customer after having food it is automatically done in the software.

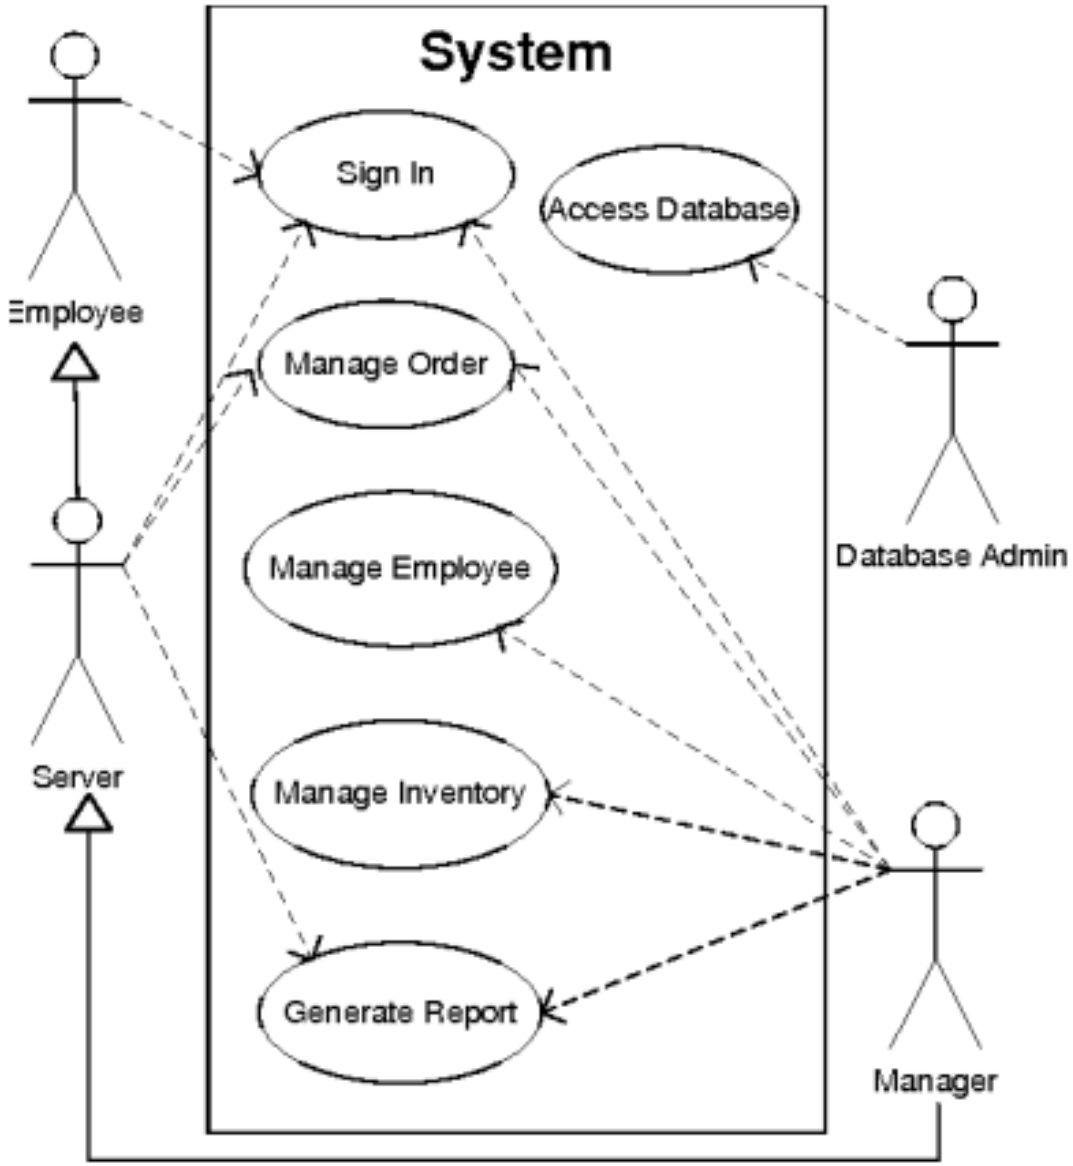
5. Loss or mishandling of data can be minimal with use of technology.

6. Use of QR (Quick Response) Code is implemented to generate after order is placed and also generated whenever a user wanted to withdraw amount from the wallet. Admin or the canteen person need to scan the QR code to initiate the transaction and the amount will be deducted respectively.

PROJECT LOGINS

PROPOSED SYSTEM

Our project will be loaded on **Android Studio and Visual Studio 2010**. We used Android and Visual studio for design and coding of the project. Implementation is the stage of the project when the theoretical design is turned out into a working system. Thus it can be considered to be the most critical stage in achieving a successful new system and in giving the user confidence that the new system will work and be effective. Created and maintained all databases into SQL Server, in that we create tables, write query to store data or record of project



PROJECT DIAGRAM

FEATURES

1. Interactive GUI.
2. Calorie count
3. Fast service.
4. No manual error.
5. Check status of order

OVERALL CONCEPT

This diagram is only used for project, if found copyright offensive legal actions will be taken.

PROJECT FUNCTIONAL REQUIREMENTS

Hardware Requirement

- Processor : Core I3
- Ram : 4 GB
- Hard Disk : 64 Bit OS
- Andriod Device with andriod OS Ver 4.0 (Icecream Sandwich) or higher.

Software Requirement

- Operating System
- Andriod Studio
- Java
- SQL Database
- Visual Studio Code
- Internet Connection

PROS & CONS

No Manual Error

Requires a lot space

- Effective & Easy to use
- Check Status of order
- No Queues
- High Security

- No Hard Copy of Receipt
- Low Chances of Hacking
